

## ABSTRACT

The invention reveals a microwave multiboiling appliance, which does not use a paper or fabric strainer. It makes coffee in a microwave oven with water and coffee powder, which is filtered when boiling, under pressure, through a metallic sieve, the coffee falling from the boiling receptacle directly into another receptacle of the appliance, ready to serve on the table in an excellent condition and with an unequaled taste, since it was boiled through friction of water and coffee in a microwave process, which refines the taste. It being filtered or strained in an average total time of about 2 minutes. Likewise, tea, loose herbs, leaves or sachets may also be utilized. Both pure milk and chocolate may also be boiled.
